

# OneDrive: Redirect your personal Desktop folder (and other important folders) to OneDrive

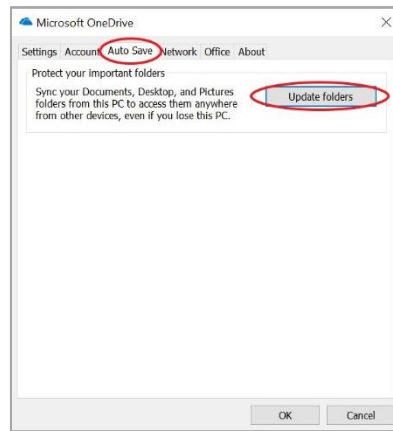

1.) Click on the OneDrive blue cloud icon  in the Windows notification area (bottom right), and then, in the OneDrive activity center, select **More**.

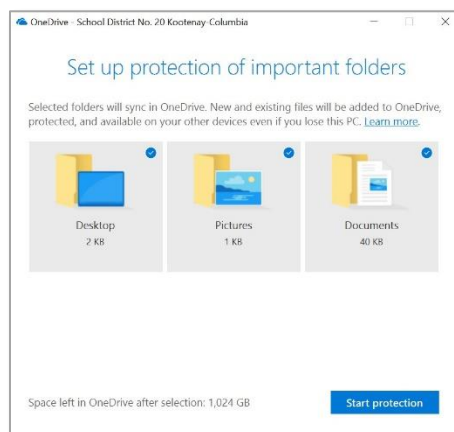

2.) Click on **Settings**.

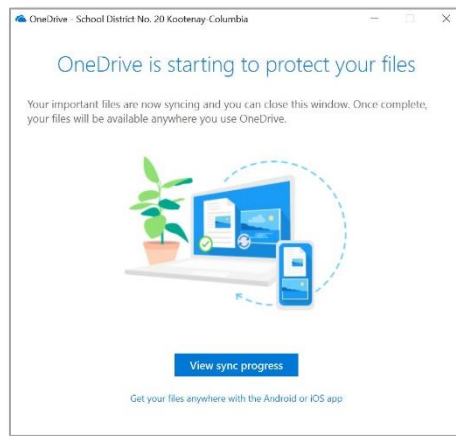

3.) A window will open. Select the **Auto Save** tab along the top and then click on **Update Folders**.

4.) In the **Set up protection of important folders** dialog box, make sure Desktop is selected and any other folders that you want to protect are selected as well. Select **Start protection**

5.) You can close the dialog box while your files sync to OneDrive. Or, to watch your files sync, select **View sync progress**. If you already closed the dialog box, select the white or blue cloud in the notification area to open the OneDrive activity center.

6.) When the files finish syncing to OneDrive, they're protected and you can access them from anywhere in Documents, Desktop, or Pictures (if selected). When you protect your Desktop folder, the items on your desktop roam with you to your other PC desktops where you're running OneDrive. You will see a check mark next to the icons on your Desktop indication that they are synced with your OneDrive.
